

## INDEPENDENT PROJECT SPECIFICATIONS

For the **first draft**, you can create this doc as follows, written on paper

15 points

- Hand-draw (or draw with a computer) image of the classes and their relationships in UML model; this is similar to the screen image of the set of brown tiles in UML model. If you borrow some code from somewhere or somebody, then write the name of the author (including you) next to *each* class tile.
- For each class, write
  - a list of fields and brief descriptions
  - a list of methods and brief descriptions
- Note about borrowed work: you may borrow up to 70% for a complicated project. Not citing the credit to the author is considered plagiarism.

For the **final copy**, you can create this doc by using 2 parts from BlueJ, printed on paper

15 point

- the screen image of the set of brown tiles in UML model
- the javadoc document showing the APIs of your project - remember that, to have a complete doc, you ***must have done the javadoc comments*** in your source code:
  - description for EACH of the following: class, constructors, methods
  - the following tags where appropriate: @author, @version, @param, @return

**THE END**
